

EO-NIROMONT lubricants for flanging and forming tools

for manual and mechanical pipe assembly

Product description

With the lubricant EO-NIROMONT you achieve low tightening torques in manual assembly and maximum tool service life in mechanical assembly. The lubricant was specially developed for tube assembly. It enables smooth and flawless sealing surfaces in forming processes.

When processing stainless steel, added substances in the lubricant prevent cold welding. Seizing of forming tools and other common problems are avoided.

The EO-NIROMONT lubricant is available in different viscosities and container sizes.

As a paste, it is suitable for lubricating pre-assembly tools, as it is economical and adheres permanently to the thread. In liquid form, it is best used directly on workpieces, progressive rings and threads during assembly.
